Rapid evolution in a conserved gene family. Evolution of the actin gene family in the sea urchin genus Heliocidaris and related genera.";

Mol. Biol. Evol. 14:654-665(1997).

-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell mollity and are ubiquitously expressed in all enkaryotic cells (By similarity).

-!- SIMILARITY: Belongs to the actin family.
-!- FUNCTION: Acting are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.

Extrachromosomal transposition of the transposable element Minos
occurs in embryos of the cricket Gryllus bimaculatus.";
Dev. Growth Differ. 0:0-0(2002)
-:- FUNCTION: Actins are highly conserved proteins that are involved
in various types of cell motility and are ubiquitously expressed
in all eukaryotic cells (By similarity).
-:- SIMILARITY: Belongs to the actin family.

Biophys. Acta 162:11-18(2003).

1. FUNCTION: Actina are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all enkaryotic cells (By similarity).

1. SIMILARITY: Belongs to the actin family.

Identifying specific binding agents for substrate binding site in CCT chaperonin complex - also new peptide binding agents and their mimetics, and peptides containing a specific CCT binding site, used for treating cancer

Disclosure, Fig 10, 97pp, English.

This invention describes a method which uses the CCT (eukaryotic type II chaperonin) complex or part of it, for identifying a binding agent that can occupy a substrate-binding site (SBS) on the CCT complex. By binding to the CCT complex, the binding agents block an SBS so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for trearment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding

By binding act to the CCT complex, the binding agents block an SBS so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for treatment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding agents may target cells that are actively synthesising tubulin etc. (unlike known microtubule-stabilising agents that affect all cells), so should have reduced toxicity for normal cells. respiratory disorders, neurological disorders, gastrointestinal disorders
                         and urinary system disorders. Ovarian antigen polypeptides and polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Disclosure; SEQ ID NO 27351; 21pp + Sequence Listing; English.

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly invention relates to an isolated nucleic acid detection reagent from WIPO at ftp.wipo.int/pub/published_pct_sequences The

Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases

Birse CE, Rosen CA; 2002-147878/19.

N-PSDB; ABQ56253

Claim 11; SEQ ID NO 4308; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to CDNAs encoding them (ABD54131-ABD563165), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to combinant vectors and host cells comprising human ovarian antigens, and the use of ovarian antigens, antibodies against human ovarian antigens, and the use of ovarian polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders Such conditions include ovarian cancer, and breast cancer, and castactic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, closucders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginted immundeficiencies, autoimmune ophoritis, systemic lupus erythematosus), clod-related disorders (e.g., anaemia), cardiovascular disorders, neurological disorders, gastrointestinal disorders

```
ö
and urinary system disorders. Ovarian antigen polypeptides and polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the bolypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                              Gaps

Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological

Claim 11; SEQ ID NO 4148; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABD56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen

```
polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, colycyptic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and cyanintis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., angenital and acquired confirmaty system disorders. Ovarian antigen polypeptides and urinary system disorders. Ovarian antigen polypeptides and polynucleotides may also be used in screening for compounds which colymulate ovarian antigen expression or activity. The polynucleotides may be used an in screening for compounds which continue and individuals and in forensic analysis, and the cleantification of individuals and in forensic analysis, and the colypeptides may be used as food additives or to prepare antibodies cuseful in disease diagnosis, drug targeting and phenotyping. The present sequence tagenessents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed sequence. The proposition is the polymulation of the printed sequence data for this patent did not form part of the printed from a for mindividual or semments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Introducing foreign gene into insect cell, involves introducing DNA having foreign gene integrated between inverted repeat sequences of piggyBac transposon and piggyBac transposase that acts on inverted repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pigA3Cy3GFP plasmid protein product (Cycle3 GFP under an actin promoter).

                                                                                                                                                            ઠ
                                                      into an insect cell. Specifically, it refers to a foreign gene occurring between inverted repeat sequences of a pigyBac transposon and using a pigyBac transposon and using a pigyBac transposon and using a reflictency. The present invention describes the insect cell as that of lepidoptera insect origin, preferably it is the silk worm Bombyx mori, and stable integration occurs into the genome of this insect using the transposace enzyme. In particular, this gene transfer method uses the planmid pigA3Cy3GFP which contains a Cycle3 GFP gene expressed under a sequences of the transposace or promoter; between a pair of inverted repeat sequences of the transposace or pigA3Cy3GFP plasmid DNA that represents the protein promoter controlling expression of the Cycle3 GFP gene given in an exemplification of the invention. NOTE: This sequence is the control of the invention. NOTE: This sequence is the control of the invention. NOTE: This sequence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treatment for sickle cell anemia comprises administering a reducing agent to inhibit and reverse sickled cell formation in blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention provides a treatment for sickle cell anaemia, which comprises administering a reducing agent. The treatment inhibits the formation of irreversible sickled cells (ISC) and reverses ISC formation in the blood. The present sequence represents the human beta-actin protein. The sequence is used in the invention to demonstrate that a disulphide bridge is formed between cystelines 284 and 373 in ISC beta-actin as a post-translational modification. The reducing agent used in the treatment acts to correct this post-translational modification
detecting the polynucleotide. The polynucleotides ADM01316-ADM01758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                               Gaps

Expression vector contg. drug resistant marker gene - useful for transformation of thymidine kinase-deleted human cells for high levels of foreign protein prodn.
                                                                                                                                                                                                               used in the expression vector of the invention. This gene is used as the selective marker in the vector. The resulting vector may be used to transform a thymidine-kinase deleted cell allowing introduction of a foreign structural gene. The transformed cell may be used to produce
                                                                                                                                                                                               This sequence is encoded by a drug resistant structural gene which may used in the expression vector of the invention. This gene is used as th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human cardiac actin (ACTC). Genotypic
                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New cardiac actin gene comprising histidine to arginine or glycine glutamic acid substitution, useful in the diagnosis of diseases associated with the mutation, specifically idiopathic dilated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cardiac actin; ACTC; human; gene therapy; IDC; chromosome 15q14; idiopathic dilated cardiomyopathy; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                         ;

(IDC). The ACTC gene maps to chromosome 15q14. Six. PCR primer pairs (AAA49020 to AAA49011) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations, one in exon 5 and one in exon 6. The present sequence is mutant of posttranslationaly modified ACTC without the initial two protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene rational drug design. The ACTC gene may be used to treat IDC by gene subjects likely to develop or who already have IDC. Note: The present sequence is not shown in the specification but is derived from the ACTC sequence described in AAY94569
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is human cardiac actin (ACTC) protein, without the initial Met-Cys which is posttranslationally removed. Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15414. Six PCR primer palrs (AAA49020 to AAA49031) have been developed to allow analysis of the six exons of ACTC studies of two families with IDC showed the presence of two mutations, one in exon 5 and one in exon 6. The mutations are G to A in codon 312 (Arg312His) and A to G in codon 361 (Glu361Gly). The ACTC protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene provides early identification of subjects likely to
analyses show that ACTC is linked to idiopathic dilated cardiomyopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or glycine to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human cardiac actin protein after posttranslational modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cardiac actin gene comprising histidine to arginine or glyci
glutamic acid substitution, useful in the diagnosis of diseases
associated with the mutation, specifically idiopathic dilated

Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15q14. Six PCR primer pairs (AAA49020 to AAA49031) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations, one in exon 5 and one in exon 6. The present sequence is a mutant of posttranslationaly modified ACTC without the initial two residues. The mutation is a Arg to His mutation at position 312. The ACTC protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene may be used to treat IDC by gene subjects likely to develop or who already have IDC. Note: The present sequence is not shown in the specification but is derived from the ACTC sequence described in AAY94569
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New cardiac actin gene comprising histidine to arginine or glycine to glutamic acid substitution, useful in the diagnosis of diseases associated with the mutation, specifically idiopathic dilated
                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In vitro assays for skin stress and skin ageing includes determination of spondin 2, cathepsin L, actin gamma 1 and vimentin fragments secreted by skin fibroblasts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to in vitro methods for the detection of skin stress and/or skin againg in humans and animals based on the determination of spondin 2, catheppsin L, actin gamma 1 or vimentin fragments secreted by fibroblast from the skin under test. Use of the methods in a test for potential cosmetics and pharmaceuticals with an effect on these skin conditions and products containing vimentin fragments are also included. Products containing vimentin fragments are effective in the regulation, especially maintenance, of skin homeostasis

Patent No. 6063576
GENERAL INFORMATION:
APPLICANT: Clson, Timothy M.
TITLE OF INVENTION: Actin Mutations in Dilated
TITLE OF ENVENTION: Cardiomyopathy, a Heritable Form of Heart Failure
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSE: Rothwell, Figg, Ernst & Kurz, P.C.
STREET: S55 Thirteenth Street, N.W., Suite 701 East
                                                                                                                                                                        Gabs
                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

-!-FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!-SIMILARITY: Belongs to the actin family.

Am. J. Physiol. Cell Physiol. 283:C1646-C1654(2002).
-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.

-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in various types of cells (By similarity).

-! SIMILARITY: Belongs to the actin family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  McGowan C., Davidson E.A., Davidson W.S.;
Submitted (MAR-2003) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TISSUE=Adrenal gland;
Buelow H.E., Bernhardt R.;
Submitted (OCT-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Actions are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.
HSSP; P02577; INMI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Zhang H., Shinmyo Y., Hirose A., Mito T., Inoue Y., Ohuchi H., Loukeris T.G., Noji S., Euckeris T.G., Noji S., Extrachromosomal transposition of the transposable element Minos occurs in embryos of the cricket Gryllus bimaculatus.";

Identifying specific binding agents for substrate binding site in CCT chaperonin complex - also new peptide binding agents and their mimetics, and peptides containing a specific CCT binding site, used for treating cancer.

Disclosure; Fig 10; 97pp; English.

This invention describes a method which uses the CCT (eukaryotic type II chaperonin) complex or part of it, for identifying a binding agent that can occupy a substrate-binding site (SBS) on the CCT complex. By binding to the CCT complex, the binding agents block an SBS so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for trearment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGK) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags that it is useful in gene therapy techniques to restore normal setuity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in

The present sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using follicular lymphoma, Hodgkin's lymphocytic leukaemia, lymphoma, follicular lymphoma and T/B cell non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.

The present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.

The invention relates to 2175 novel human ovarian antigens (ABB41054-ABB43228) and to cDNAs encoding them (ABG54131-ABG56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen to polynucleotides, antibodies against human ovarian antigens and the use of ovarian intigens of polynucleotides and polypeptides in diagnosing, treating prognosing or preventing various ovary and/or breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast of pregnancy, anovulation, disorders (e.g., infertility, disorders of pregnancy, anovulation, collisorders (e.g., infertility, disorders of pregnancy, anovulation, oplycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic conspinitis), immune disorders (e.g., conganital and acquired immunodeficiencies, autoimmune ophoritis, systemic lupus erythematosus, respiratory disorders (e.g., anaemia), cardiovascular disorders, respiratory disorders, neurological disorders, respiratory disorders, neurological disorders, respiratory system disorders. Ovarian antigen polypeptides and urinary system disorders. Ovarian antigen polypeptides and compounds which

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapentic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to encoding the polypeptides and cells genetically engineered to everyees them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon cand/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                              ö
modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 99% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoes), endocrine chock syndrome, inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired

immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders, acepiratory disorders, neurological disorders, gastrointeetinal disorders and urinary system disorders. Ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.

           detection, diagnosis and therapy of haematological malignancies. The present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hoddkin's lymphoma, non-Hoddkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.

malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen(s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen(s) in a sample obtained from the patient (an increased level of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB59111 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the invention and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic, neuroprotective; antiviral, antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The mucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Breast and ovarian cancer associated antigen protein sequence SEQ ID 755.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.
polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; breast cancer; ovarian cancer; cytostatic; immunosuppressive; noctropic; neurpprotective; antiviral; antiallergic; hepatotropic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; immune disorder; Addison's disease; allergy; autoimmune haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; Crohn's disease; multiple sclerosis; rheumatoid arthritis; ulcerative colitis; cardiovascular disorder; wound healing; neurological disease.

The invention relates to cancer-associated proteins (CAP) and the cancer-associated (CAP) nucleic acids encoding them. The invention also relates to a method for treating cancers involving administering to a patient and inhibitor of CAP, and a method of screening for anticancer activity in a contential drug involving providing a cell that expresses a CA gene, contenting at issue sample derived from a cancer cell with an anticancer drug candidate on expression of the CA gene. The CAP proteins are useful for detecting cancer associated with expression of a CAP protein in a test cell sample and for screening for a bioactive agent capable of modulating the activity of a CAP protein. The CA nucleic acids are useful for diagnosing cancer, involving determining the expression of a CA nucleic acid in a tissue. This sequence represents a human CAP of the invention. Note: The sequence data for this patent did not form part of the printed cape specification, but was obtained in alectronic format directly from WIPO.

The inversion relates to a complex between two interacting processing the inversion relates to a complex between two interacting about protein from a known adipocyte marker and then by selecting a bait protein from a known adipocyte marker and then complex of an adipocyte cDNA library. The proteins are designated SID complex of an adipocyte cDNA library. The proteins are designated SID complex of an adipocyte cDNA library proteins. Also included are a recombinant host cell expressing at least one of the interacting oplymeptides of the complex, selecting a modulating compound in adipocyte cells, a recombinant host cell expressing at least one of the interacting polymeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polymeptide comprising any of the 738 amino acid a SID (RTM) polymucleotide comprising any of the 738 mucleotide sequences given in the specification (including its fragment or variant), a vector comprising the vector, a protein chip comprising the polymeptides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID particularly useful for identifying selected interacting domains (SID particularly useful for preventing or treating or treating domains (SID particularly useful for particularly useful for identifying selected interacting domains (SID)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for screening drugs that modulate the protein interaction, thus
ting the therapeutic effect. The present sequence represents a SID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      molecules and the encoded proteins thereoff. Specifically, it refers to clones obtained by an oligo-capping method, where none of these clones are identical to any known human manas. The present invention clones are identical to any known human manas. The present invention clones are identical to any known human manas. The present invention clones are identical to any known human manas. The present invention and immunoassay to identify agonists and antagonists, as well as antibodies, antienese molecules and siRNas that can all be used to bind to and modulate expression of the cONA molecules. As such, hese molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Altheimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic, Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein encoded by a full length human cDNA sequence of the invention.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fixed by the patent did not appear is the sequence and the sequence for this patent did not appear in the printed specification, but was obtained in fire.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 10409, Application US/09949016
Patent No. 6812339
GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
CURRENT APPLICATION NUMBER: US/09/949,016
CURRENT FILING DATE: 2000-04-14
PRIOR FILING DATE: 2000-10-20
PRIOR FILING DATE: 2000-10-20
PRIOR FILING DATE: 2000-10-3
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-09-08
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Sequence 7121, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
FILE PEPERENCE: CL001307
CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755
PRIOR APPLICATION NUMBER: 60/237,768

PRIOR APPLICATION NUMBER: 60/237,768
